In mathematics, structural stability is a fundamental property of a dynamical system which means that the qualitative behavior of the trajectories is unaffected by small perturbations (to be exact C^1 -small perturbations).

About. A gramian matrix W is the result of all inner products of a set of vectors $V = (v_1 \dots v_n)$, in other words:
 $W = V^T V$. Properties of (linear) control systems can be assessed by the system gramians, which are based
on the controllability and observability operators.

With the growing success of neural networks, there is a corresponding need to be able to explain their
decisions – including building confidence about how they will behave in the real-world, detecting model
